

# tinyML<sup>®</sup> Summit

*Enabling Ultra-low Power Machine Learning at the Edge*

## Perspectives & Challenges for TinyML Hardware: a System-Level View

Dr. Francesco Conti, 30 Mar 2022

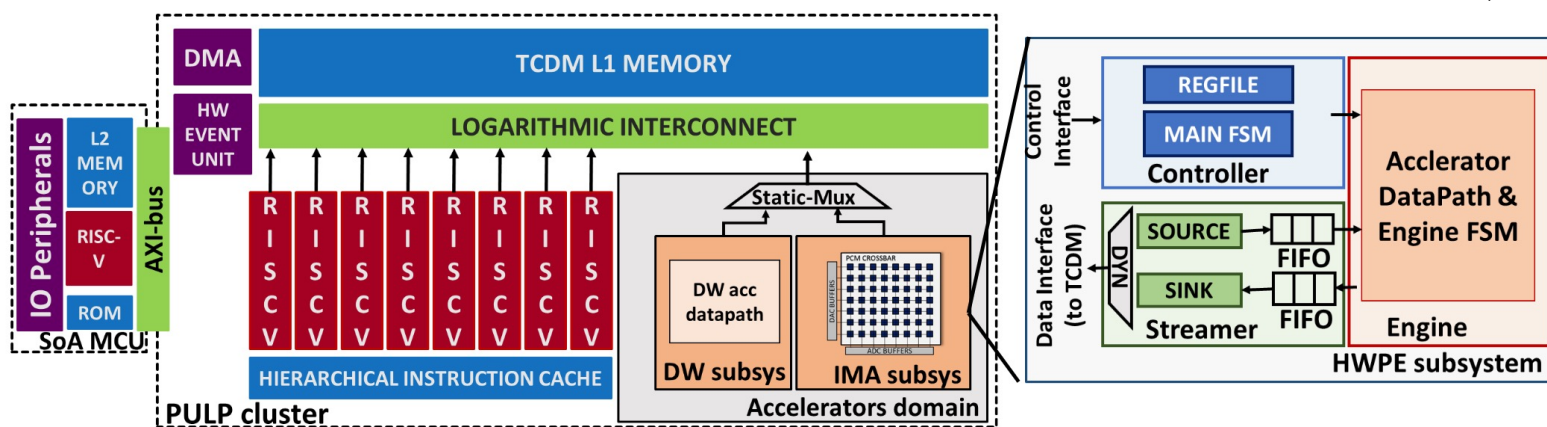

[www.tinyML.org](http://www.tinyML.org)

# tinyHW Panel

*Abstract:* TinyML inference on ultra-low-power hardware is finally here to stay. But what are the perspectives for the future of this technology? Will Analog In-Memory Computing take up the scepter of crucial technology for TinyML from digital accelerators? Will TinyML hardware evolve to support learning as well as inference? In this session, we discuss the main challenges and opportunities ahead for TinyML hardware from the perspective of using it in real embedded systems.

# Integrating AIMC @ system level

AIMC: Real performance depends on **system integration** (e.g., bandwidth) but also on **workload** (even more than digital?)

# AIMC or Digital?

*What technology will emerge as go-to for TinyML hardware? Is the efficiency gain of AIMC enough to move TinyML systems in this direction?*

# DNN Memory Footprint (2019/20)

## ImageNet Top-1 Accuracy vs Memory Footprint

- Most entries > 10 MB
- Pareto Frontier Acc vs Memory  
(from 50% @ 0.5Mparam  
to 85% @ 445 Mparam)
- Not necessarily representative of real-world  
problems (might be more complex)
- **Almost always require off-chip DRAM!**

***Memory** is one of the primary constraints when looking at TinyML hardware from a system perspective*

*How can we design TinyHW that supports upscaling the complexity of TinyML (e.g., larger nets)?*

# Learning on device?

*The next level of “intelligence” is being able to capture and retain knowledge from the environment with on-device learning and adaptation.*

*What steps are necessary to get there?*
