## Adaptive AI for the Intelligent Edge

[Latentai.com](https://latent.ai)

## Maxim Integrated: Enabling Edge Intelligence

### Advanced AI Acceleration IC

The new MAX78000 implements AI inferences at low energy levels, enabling complex audio and video inferencing to run on small batteries. Now the edge can see and hear like never before.

[www.maximintegrated.com/MAX78000](http://www.maximintegrated.com/MAX78000)

### Low Power Cortex M4 Micros

Large (3MB flash + 1MB SRAM) and small (256KB flash + 96KB SRAM, 1.6mm x 1.6mm) Cortex M4 microcontrollers enable algorithms and neural networks to run at wearable power levels.

[www.maximintegrated.com/microcontrollers](http://www.maximintegrated.com/microcontrollers)

### Sensors and Signal Conditioning

Health sensors measure PPG and ECG signals critical to understanding vital signs. Signal chain products enable measuring even the most sensitive signals.

[www.maximintegrated.com/sensors](http://www.maximintegrated.com/sensors)

# Qeexo AutoML

Automated Machine Learning Platform that builds tinyML solutions for the Edge using sensor data

## Key Features

- Supports 17 ML methods:
  - Multi-class algorithms: GBM, XGBoost, Random Forest, Logistic Regression, Gaussian Naive Bayes, Decision Tree, Polynomial SVM, RBF SVM, SVM, CNN, RNN, CRNN, ANN
  - Single-class algorithms: Local Outlier Factor, One Class SVM, One Class Random Forest, Isolation Forest
- Labels, records, validates, and visualizes time-series sensor data
- On-device inference optimized for low latency, low power consumption, and small memory footprint applications
- Supports Arm® Cortex™ - M0 to M4 class MCUs

## End-to-End Machine Learning Platform

For more information, visit: [www.qeexo.com](http://www.qeexo.com)

## Target Markets/Applications

- |                                     |              |

[Reality AI](#)

## Pre-built Edge AI sensing modules, plus tools to build your own

### Reality AI solutions

Prebuilt sound recognition models for  
indoor and outdoor use cases

Solution for industrial anomaly detection

Pre-built automotive solution that lets cars  
“see with sound”

### Reality AI Tools<sup>®</sup> software

Build prototypes, then turn them into  
real products

Explain ML models and relate the function  
to the physics

Optimize the hardware, including  
sensor selection and placement

# Build Smart IoT Sensor Devices From Data

SensiML pioneered TinyML software tools that auto generate AI code for the intelligent edge.

- End-to-end AI workflow
- Multi-user auto-labeling of time-series data
- Code transparency and customization at each step in the pipeline

We enable the creation of production-grade smart sensor devices.

[sensiml.com](https://sensiml.com)

# SynSense

**SynSense** builds **sensing and inference** hardware for **ultra-low-power** (sub-mW) **embedded, mobile and edge** devices. We design systems for **real-time always-on smart sensing**, for audio, vision, IMUs, bio-signals and more.

<https://SynSense.ai>

# SYNTIANT

## Neural Decision Processors

- At-Memory Compute
- Sustained High MAC Utilization
- Native Neural Network Processing

## ML Training Pipeline

- Enables Production Quality Deep Learning Deployments

**End-to-End  
Deep Learning  
Solutions  
for  
TinyML & Edge AI**

## Data Platform

- Reduces Data Collection Time and Cost
- Increases Model Performance

## Why ML

We are overwhelmed by data, and the number of data we could or do collect is growing every day.

We believe data is a tool to take **informed decisions**, ML allows us to extract information from these data.

It could be choosing to **open** an additional **security check** queue in an airport, or **improving the quality** of a process, **recommend** what **setting** should be best or performing a challenging operation automatically; whenever we can achieve even the smallest intelligent solution, we transform data into valuable information.

## Why Tiny

Because often there is **no other option**.

Or when we do have other options, choosing the computation at the edge ease everything else.

If our sensors become intelligent, we don't design logics, we build processes.

This is a crucial change of approach in designing industries, where obtaining a simple information like “correctly produced products” is challenging.

Since we need to distribute intelligence in order to achieve flexibility, we need ML algorithms, libraries and solutions that allow us to deploy even on the lowest compute power.

# 1 | A few examples

What if a **photocell** became a little camera, checking real time not only if something is going on the conveyor belt, but taking and elaborating **pictures**.

We could

- Have an exact counting of seen products
- Detect if the product is the correct one
- Perform some simple quality check  
(*Is the bottle correctly capped?*)

Then, all the other machinery could receive not only a simple counting, but events that need actions or decisions to be taken.

[bit.ly/3pOBFAU](https://bit.ly/3pOBFAU)

## 2 | A few examples

What if we want to build a sensor for blood in extracorporeal circulation that can be attached on the tube and able to read some blood parameter?

It could ease the work of many doctors, performing a real time monitoring on the condition of the patient, without having to rely on big and expensive machines. Although not being “industrial”, quality of the result is strictly conditioned by its **production variability**.

What if an electro-valve is able to detect itself when having a quickly deterioration of its performance.

It could notify the machine it needs to be changed and schedule maintenance in advance.

# What we learned – Robustness is everything

When we deploy machine learning models on devices with very strict constraints we focus extremely on performance and robustness.

Quoting the EU, we need a Trustworthy AI, and among the many aspects we have to be sure our model is robust.

How we achieve robustness

- Under-parametrized models
- Synthetic data
- Data augmentation
- Model testing and validation

# What we learned – Robustness is everything

We submitted a paper on how we built and tested a ML Model on STM32 micro at the International Conference on Software Testing, Verification and Validation 2022 (ICST 2022).

All the code will be open sourced in the ROBY package:

*ROBustness anaLYzer for neural networks*

# Being robust to achieve flexibility

We live in a world that is evolving faster than ever.

Clients are better informed, with new priorities and changing needs in transparency, quality, sustainability and personalization.

Although this is exciting, our industries are not designed to be flexible. We need intelligence to achieve this resilience, even the smallest component should be intelligent enough to face the challenges of the future.

## AI AS AN ENABLER FOR LONG-TERM RESILIENCE IN MANUFACTURING

Group Leader

**Erwin Rauch**

Assistant Professor in Manufacturing Systems, Head Smart Mini Factory Lab for Industry 4.0, Free University of Bolzano

October 2021
